

try this out, I did not test it, but from what i see in you have a couple of issues in your code, alliances is not and red are not json arrays, they are json objects bas json document,

```
JsonObject rootobj = root.getAsJsonObject();
JsonElement match_number = rootobj.get("match
JsonObject alliances = rootobj.getAsJsonObjec
JsonElement blue = alliances.getAsJsonObject
JsonElement red  = alliances.getAsJsonObject

System.out.println(match_number.getAsString
```

Your Answer

Potential API Misuse

You may want to check whether match\_number.isJsonPrimitive() returns true. You may also want to handle the potential Exception thrown by getAsString() by using a try-catch block here. 48 Github code examples also do this.

```
try {
    if (match_number.isJsonPrimitive()) {
        match_number.getAsString();
    }
} catch (Exception e) {
}
```
