

try this out, I did not test it, but from what i see in your code, alliances is not an a json array, a json objects based on what i see in your json document

```
JsonObject rootobj = root.getAsJsonObject();
JsonElement match_number = rootobj.get("match_number");
JsonObject alliances = rootobj.getAsJsonObject("alliances");
JsonElement blue = alliances.getAsJsonObject("blue");
JsonElement red = alliances.getAsJsonObject("red");

System.out.println(match_number.getString());
```

just to note, i just tested it and it works fine. – faljbour Apr 25 '15

Thanks a lot!!! – Alex Webber Apr 25 '15 at 4:42

## ① Pop-up window

Potential API Misuse

### ② API misuse description

You may want to check whether the receiver of `getString` is not null. 119 Github code examples also do this.

```
if (match_number != null) {
    match_number.getString();
}
```

### ③ Fix suggestion

See this in a GitHub example:
